

What's Your Hazard Avoidance Profile?

Over time, the concerns of the Pioneers tend to migrate to the rest of the market. Look to the group before yours to see what might be next. →

Their Role in the Market

When most of us haven't heard of these hazards, their research and advocacy create awareness and leave a path of disclosure .	Once alerted, they make avoidance a priority, providing support for market development of alternatives.	When both hazards and alternatives are clearly identified, they provide critical mass to push prices down and bring alternatives within reach.	Their broad base of demand helps complete market transformation away from a known hazard.	They work to remove chemicals from existing building stock and in specialty products, while also providing advocacy in weakly regulated markets .

When They'll Choose Alternatives

If they're doing a Living Building Challenge project or if the project type or client demands it.	If hazards are well documented—even if there is a cost premium and choices are limited.	When a hazard has become very well defined and alternatives are available—especially if the alternatives are higher-performing.	When the "alternative" has become the obvious choice with little or no cost premium or inconvenience.	They'll help enact bans on hazards to bring alternatives even to the laggards.
